

## The Cloud Ready OS

**CloudLinux** is the only commercially supported operating system (OS) optimized for datacenters and hosting providers who sell servers to enterprise and small business customers.

**CloudLinux** is binary compatible with the most popular RPM-based Linux distribution (derived from RedHat EL) and is optimized to work with hosting control panels to deliver faster and fully-tested updates and commercial support.

**CloudLinux** is optimized to serve dynamic websites fast and securely by using Lightweight Virtual Environment™ technology (LVE).

LVE technology allows the server to transparently isolate different areas of a website. This isolation allows for limiting the amount of resources any part of the website gets, making sure that important areas of the website have enough resources to operate at top speed, even if other parts of the site are under heavy load.

**CloudLinux** increases server stability and efficiency, is a commercially-supported OS and is priced at a fraction of its competitors, making it a better choice for you and your customers.

***CloudLinux is the Clear Winner!***

### Bottom-Line Benefits

#### BOOST PERFORMANCE

Provide better performance and speed by improving the resource management capabilities of your servers.

#### INCREASE STABILITY

CloudLinux increases server density by improving stability and efficiency using isolation technology to wrap websites or sections of a website in a Lightweight Virtual Environment™ (LVE). This limits the amount of resources any site can use so that no single account can slow or take down an entire server.

#### STAY CURRENT

CloudLinux tests updates against major control panels so they are truly integrated – making it a better choice for your customers.

#### GET UPDATES FASTER

Why wait for patches and updates with other distributions? CloudLinux product updates are delivered faster so your customers have the most updated version without delay.

#### SAVE TIME WITH COMMERCIAL SUPPORT

Why waste time researching answers to support the OS? Submit a ticket to CloudLinux and let our experts find the answer for you.
